Problem Description

We want to design an app that promotes healthy eating amongst families by turning it into a game

SDG Goal 3: Good Health and Well-being
SDG Goal 12: Responsible Consumption and Production

Anecdote

- When I moved to university, my mom didn't ask about my grades, she asked what I was eating.
- Tracking apps like MyFitnessPal are tedious chores with 80% churn, and messaging apps lack any health intelligence.
- We built this to turn daily food updates into an effortless health connection.

NURTRITION

Nurturing nutritious habits

Core Issue

Core problem: Standard dietary logs suffer an 80% abandonment rate from tedious manual logging

User adoption strategy: Turn it into a game

Target Audience

Family members who don’t eat every meal together

CASE STUDIES

Our app could connect families in a similar way to *setlog* through their recording habits, even if they are across the globe.

Snapchat is also a daily log app, with streaks for photos etc.

HOW IT WORKS

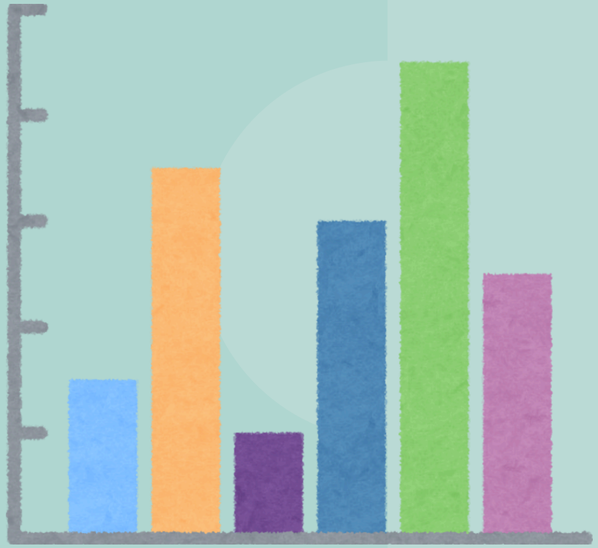

Take a picture

At meal times or otherwise, you can take a picture of your meal

Analysation

AI will analyse the meal and output a health score based on the nutrition content of the meal

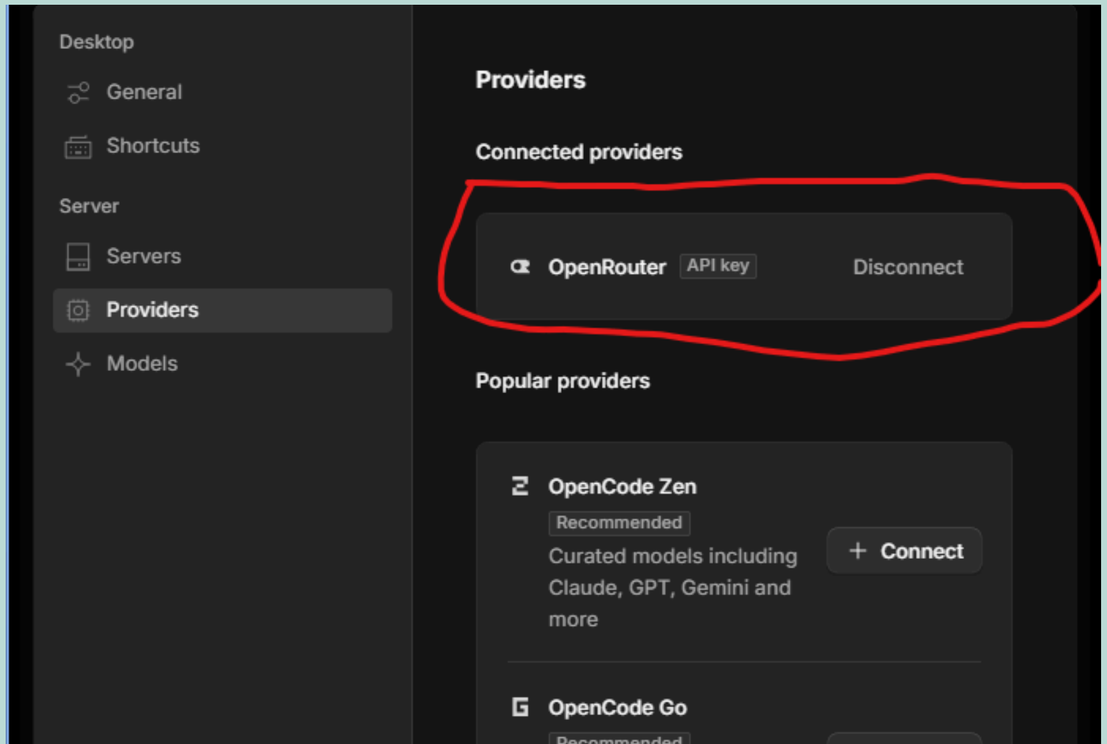

End of week Insights

See the rankings of each family member AI generates personalized insights for everyone and how to improve on their diet

How OpenRouter was used

- been using OpenRouter for 2 years now
- LLM provider router for coding agents in OpenCode,
- VLMs to identify and determine the nutritional value of the food

How OpenRouter was used

- **google/gemini-3.8-flash**: Process images and extract ingredients (lightweight, cheap)

- **openai/gpt-6-luna**: Reasoning on weekly insights for in-depth (reasoning, expensive)

DESIGN CONSIDERATIONS AND LIMITATIONS

- User churn rate on digital health tracker systems
  - 5s per photo (dependent on API server)

- Cheating in eating healthy
  - Inter-family competition → less motivation to cheat

DESIGN CONSIDERATIONS AND LIMITATIONS

- Under-reporting or over-reporting
  - AI does the measuring and score calculations, with transparent score calculations, makes it harder for the user to over-report, as we rely on VLM with a strict prompt
  - AI media detection, i.e. cheating with AI images are detected before routing to an LLM

IMPROVEMENTS

Introduce more features for paid user

- Instant export to Instagram/Snapchat with filters and stickers

Stress test APIs

- Using gemini-3.8-flash might be expensive if ran for a lot of users, considering gemini-3.8-flash-lite and record trade-offs

Production based Supabase

- Use prod settings
